SUMMARY

Senior IT Analyst at General Catalyst with five years across identity and access management (Okta, Google Workspace), GCP, and IT operations automation. I work at the intersection of identity, cloud, and internal tooling, building and maintaining the systems that let a ~500-person firm operate securely and consistently as it scales. Builder at heart: if a process is manual, repetitive, or unowned, I'd rather write the workflow than keep closing the ticket.

EXPERIENCE

General Catalyst — Senior IT Analyst 07/2026 — Present

San Francisco, CA

Co-lead the Okta program with the IT Engineering Director. Offices: SF, NYC, Cambridge, DC, London, Berlin, Bangalore.

Serval Platform and Lifecycle Automation

- Inherited GC's Serval instance (AI-native ITSM) with no production owner and made it IT's system of record, growing it from ~70 workflows to 330+ published (TypeScript on the Serval SDK) covering Google Workspace, Okta, Jamf, Slack provisioning, BambooHR sync, the employee lifecycle, ticket automation, and analytics.
- Moved all intake (email and Slack) off Zendesk and decommissioned it within a week. Migrated the full Zendesk history, 53,000+ tickets back to 2022, into Serval before cutover so three years of answered questions came along.
- Since cutover, Serval's help desk agent has fully resolved 30% of closed employee requests, counting only tickets no human touched; those close in minutes.
- Decommissioning BetterCloud, both halves of it: the workflow engine and the Google Workspace management console. Workflows: 42 of 47 rules replaced with Serval workflows or native Google Admin policy, last five in flight; rebuilt onboarding and offboarding in Serval (onboarding polls BambooHR and handles legacy-account collisions).
- Replacing the console with a 26-command Google Workspace admin library the team runs from Slack in plain English (users, groups, OUs, Drive, Gmail, Calendar); destructive actions need a second approver. Scheduled controls enforce the Gmail forwarding policy, remediate public files, flag external sharing, and poll the audit log every 15 minutes.
- Built scheduled, approval-first offboarding that snapshots access before removing it and reclaims seats. Contractor-to-FTE conversion and OU, profile, and group drift monitors share the same lifecycle foundation.
- Audited the ~70 workflows I inherited and tightened the rules: blocked self-approval, required a justification on every approval step, assigned approvals to groups rather than people, pulled API keys and webhook secrets out of workflow source, re-homed vendor tokens off a departed admin, and cut org admins from 10 to 5.
- Built two Serval dashboards on TypeScript workflows that separate employee demand from machine alerts, lifecycle automation, and imported Zendesk history, plus a failed-run digest, approval watchdogs, and SLA and aging reports.

Identity, Security, and Tooling

- Cleaned up Okta identity governance: backfilled account types on 495 users, rewrote four legacy group rules to key on account type and segment, cleared 138 pending-review accounts, and retyped 127 stale accounts. The daily drift audit dropped from 148 findings to 15.
- Moved KnowBe4 provisioning for 500+ users from Active Directory Integration to Okta SCIM via rule-based groups, with no re-enrollment or repeated training for anyone already enrolled.
- Put IT in front of third-party access: an Entra admin-consent workflow (one approval per app, no tenant-wide grants) for Make.com and SharePoint/OneDrive, the Glean Super Admin gap closed with CTO sign-off, and one scoped gmail.send OAuth pattern reused across three internal apps.
- Pushed the Active Directory sunset forward by retiring the GCDS OU sync that kept reverting Google OU placements, standardizing the OU structure onboarding builds on, and testing it with simulated syncs before cutover.
- Ran a read-only Google Workspace security audit (admin access, Gmail, sharing, OAuth apps, alerting) and turned it into 19 tracked fixes, each gated on an explicit decision.
- Shipped the Greenhouse-to-Ashby cutover across Google Workspace, Zoom, SSO/SCIM, and HelloSign.
- Stood up Google Cloud Workstations with a reproducible image for builder onboarding, unblocking Windows users.

General Catalyst — IT Analyst 11/2023 — 07/2026
San Francisco, CA

- Co-led the H1 2026 Okta migration with the IT Engineering Director: 25+ SaaS apps moved to Okta on SAML and SCIM, authentication policies built, app lifecycle set up end to end.
- Built and owned the Manager Portal (Node.js/Express) for managers to pre-provision apps, distribution lists, and Slack channels before start dates, backed by Serval SCIM workflows.
- Closed the most help desk tickets on the team in 2025 (4,000+, excluding walk-ups and Slack) while running the SF office solo, co-owning global processes with NYC, Cambridge, and London, and onboarding 105+ employees.
- Built a Python pipeline (OpenAI, Tavily, BigQuery, GCS) that extracts executive names for portfolio companies.
- Ran firm-wide KnowBe4 phishing campaigns (click rate under 8%) and managed Jamf, Intune, and CyberArk endpoints.
- Took 2nd in GC's 2026 internal hackathon, against a field of senior engineers, with an auditing and knowledge-builder tool. GC Values: Serve Others Award, 10/2025.

Keep IT Simple (MSP) — Desktop Engineer 08/2021 — 11/2023
Fremont, CA

Engineer of the Year, 2022.

- Led a three-month migration of 1,000+ Recology endpoints from Windows 8 to Windows 11, including WS1 imaging and vendor coordination.
- Worked an active ransomware incident at Kyocera Laser: containment, endpoint isolation, log analysis, and forensics.
- Ran onboarding and offboarding for 150+ users through Active Directory, M365, and Okta MFA; provided Tier 1/2 support across Kandji, Intune, and Mimecast for multiple clients.

SKILLS

Cloud & Infrastructure GCP (Cloud Run, Pub/Sub, Secret Manager, GCS, BigQuery), Terraform (IaC), Docker, Cloudflare

Automation & Code TypeScript, Python, Bash, Node.js/Express, REST APIs, GitHub Actions (OIDC/WIF), Serval SDK

Identity & Endpoint Okta (SSO, SCIM, group rules, auth policies), Google Workspace (Admin, Drive, Gmail, Calendar APIs), Entra ID, M365, SAML/OIDC, Active Directory, Jamf, Intune, Kandji, WS1, CyberArk

Security OAuth and admin-consent governance, phishing simulations (KnowBe4), incident response, CIS/NIST audits

IT & ITSM Serval, Zendesk, FreshService, Jira, Confluence, ITIL 4

AI Tooling Perplexity Computer, Claude Code, Claude and OpenAI APIs, MCP connectors, Glean

EDUCATION

Georgia Institute of Technology — M.S. Computer Science (in progress) Expected 06/2029
Western Governors University — B.S. Computer Science 10/2025
Linux Professional Institute — Linux Essentials

PROJECTS

Fresh Prints Newspaper-style daily tech brief. GitHub Actions ingests RSS, Hacker News, and Reddit hourly via an OIDC-authenticated Cloud Run API; Claude writes the morning edition as a web broadsheet and a 6am email. Express + React, SQLite on a GCS volume, GitHub OAuth allowlist.

Trapdoor Credential honeypot behind a decoy admin hostname. A Cloudflare Worker fronts a Cloud Run origin; every probe is logged to a retention-locked GCS bucket and alerted to Discord (one alert per IP per 10 minutes).

GCP Project Factory (POC) Event-driven provisioning: Pub/Sub triggers a Cloud Run worker that runs Terraform to standardize project creation. Multi-root Terraform layout with GCS remote state.

Perplexity Skills Library 30 custom agent skills for IT operations: CIS/NIST-anchored GCP, GitHub, and Workspace security audits, Cloud Run deploy and auth patterns, vendor and hardware security reviews, phishing analysis.

Pokémon Emerald ACE Reproducible arbitrary code execution exploit via the Glitzer Popping vulnerability, with memory corruption and execution primitives documented end to end.
